Why it should work

US stock indices have tended to rise in the 24 hours before a scheduled Federal Reserve (FOMC) announcement (Lucca & Moench, *Journal of Finance* 2015). The usual explanation is a reward for holding stocks into a big, uncertain event. Of all the academic calendar effects we tested, it is the only one still profitable after FTMO's costs.

The rules

- **Markets:** US100.cash and US500.cash.
- **Buy at 2:00pm New York time on the first day of each scheduled Fed meeting** (the day before the statement).
- **Sell at 1:58pm New York time on announcement day**, just before the 2:00pm statement — it never holds through the announcement.
- **Safety stop** 3% below the entry. The worst event since 2014 was −1.9%.
- Scheduled meetings only. The dates for 2021–2027 are built into the bot's settings.

Size

- **$20,000 notional per index.** A typical event moves each position by about ±$150.
- The worst event since 2014 would have cost about −$380 per index (about −$760 for both).

How it was tested

Test	Result
Research, 2014–2026, 1-hour bars, after costs and one night of swap	NAS100 +0.22% a trade, US500 +0.14%; positive in 2014–20, 2021–23 and 2024–26
cTrader backtest, M1 bars, Jan 2021 – Oct 2026, $20k per index	+$4,325, profit factor 2.07, 92 trades, max drawdown 1.5%, largest loss −$359
US100 by period	2021–23 +$2,260 · 2024–26 +$682
US500 by period	2021–23 +$1,339 · 2024–26 +$44 (about flat lately)
Timing check	Every trade held 23 h 58 min, exactly as designed

Running it

- Attach **FOMC_Drift.cs** to a **US100.cash, 1-hour** chart on the FTMO account. Leave the defaults.
- First live trade: **27 October 2026** (sold on 28 October before the statement).
- **Once a year**, add the next year's meeting day-1 dates from the Fed's calendar (federalreserve.gov → Monetary Policy → FOMC calendars) into the "Extra Dates" setting.

Switch-off rule (monthly review)

Pause the bot if its last 16 trades (about one year) are net negative, or if a single event loses more than 3%. It is small and has been weakening on US500, so it is an add-on, not an income engine.
