01 3-year net profit — instrument × reward target

INSTRUMENT (NET OF COSTS)	2.0R	2.5R	3.0R	3.5R	BEST
US30	+\$6,561	+\$8,694	+\$10,033	+\$8,498	3.0R
NAS100	+\$2,626	+\$5,263	+\$7,031	+\$7,807	3.5R

Decision: US30 at 3.0R delivers the highest net total (+\$10,033). NAS100 (best +\$7,807 at 3.5R) earns comparable dollars in ~35% fewer trades with roughly half the drawdown and is profitable every year — the preferred vehicle on risk-adjusted terms. Higher targets help up to ~3R, then plateau.

3-yr total	398	131	267	33%	–	–	+\$7,807	\$107,807

The edge survives costs After spread, US30 3.0R nets +\$10,033 and NAS100 3.5R nets +\$7,807 — profitable in all four calendar years.	Plan for losing streaks Win rates are 20–43%; runs of 7–9 consecutive losers occur every year. Sizing and psychology must absorb this.	Next step Forward-test NAS100 (balanced 60pt/2.0R and 3.5R) on demo for 4–8 weeks before committing capital.
---	--	--

Method. Dollars = R × \$100 (stop-size independent). Wins/losses = trades closed in profit/loss; streaks are consecutive in date order. Dealing cost = one bid/ask spread per trade (spread-bet indices carry no separate commission); slippage on stops not modelled. First qualifying high-volume breakout per day. Backtest on cTrader M5 data, not live results; 2023 & 2026 are part-years. Source: scripts/dollar_report.py.
